

User guide

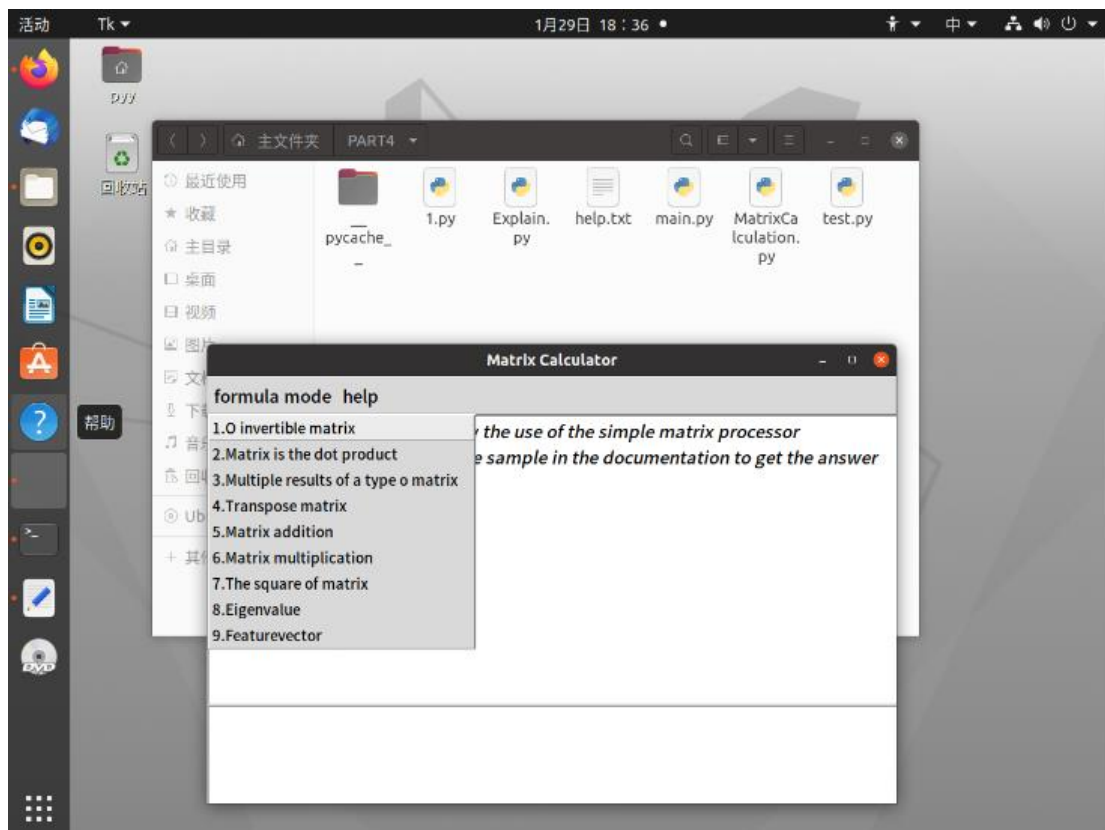

This calculator is written in python language. If you want to use this software, you need to install numpy, tkinter library. The numpy library can be used to handle matrix calculations, and the tkinter library is used to generate GUI interfaces.

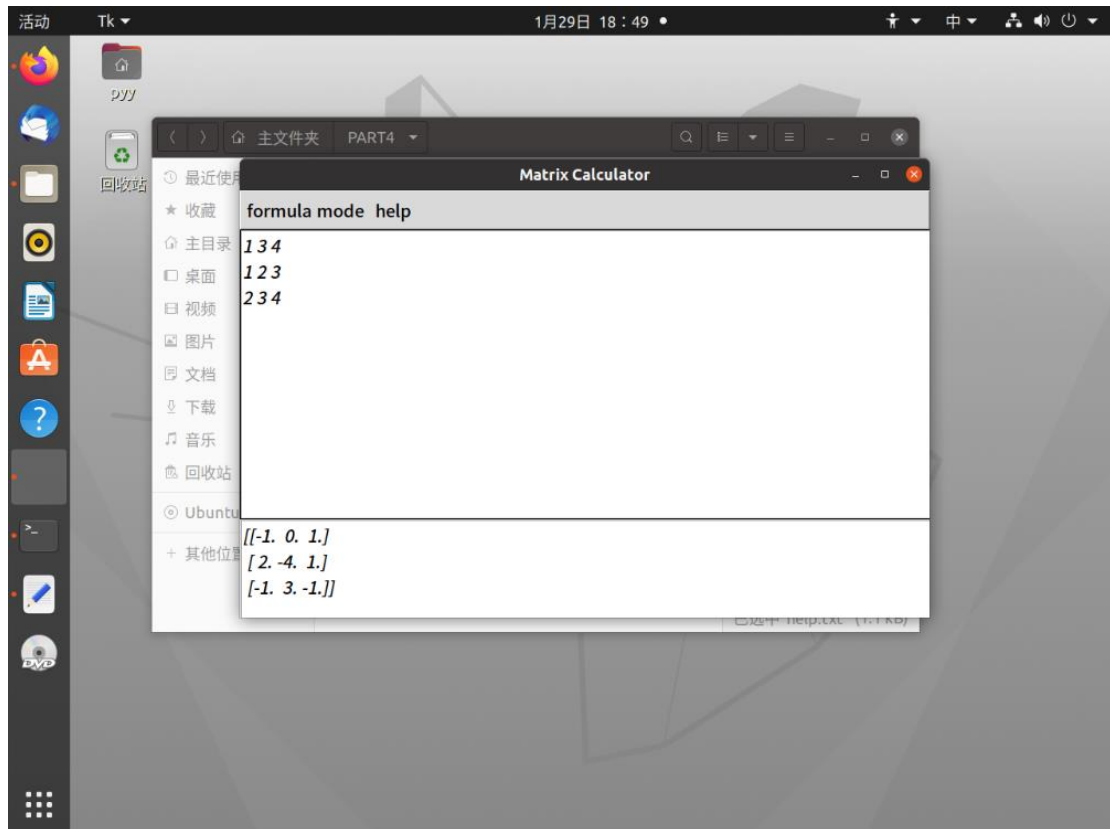

When you open the python program, a line in the text box tells you to click help if you want to know what format you want to enter

Clicking Input considerations. Generates a txt document in the current folder with instructions on how to enter the correct schema.

In formula mode, there are nine calculation modes about matrix.

We take the first inverse matrix as an example, enter a matrix randomly and click inverse matrix in formula mode. I'm going to get a calculation.
